The articles are prepd, by forming and ateaming for 12 hrs. at 97°C,	DETAILS The clay (II) is obtd. by calcina	owed by grinding. A typical mixt. contg. (in wt. %): (1) 20, (II) 20 and (III) 60, yields articles with compressive strength of 330 kg/cm <sup>2</sup> . Tests show that increase the	amt. of (II) in the mixt. increases the gth of the resulting articles by 2.8-3.
